GRDA timing rule

Six waves give five neighboring duration changes.

Change = |next - previous| / previous.

At least 3/5 changes must be <50%.

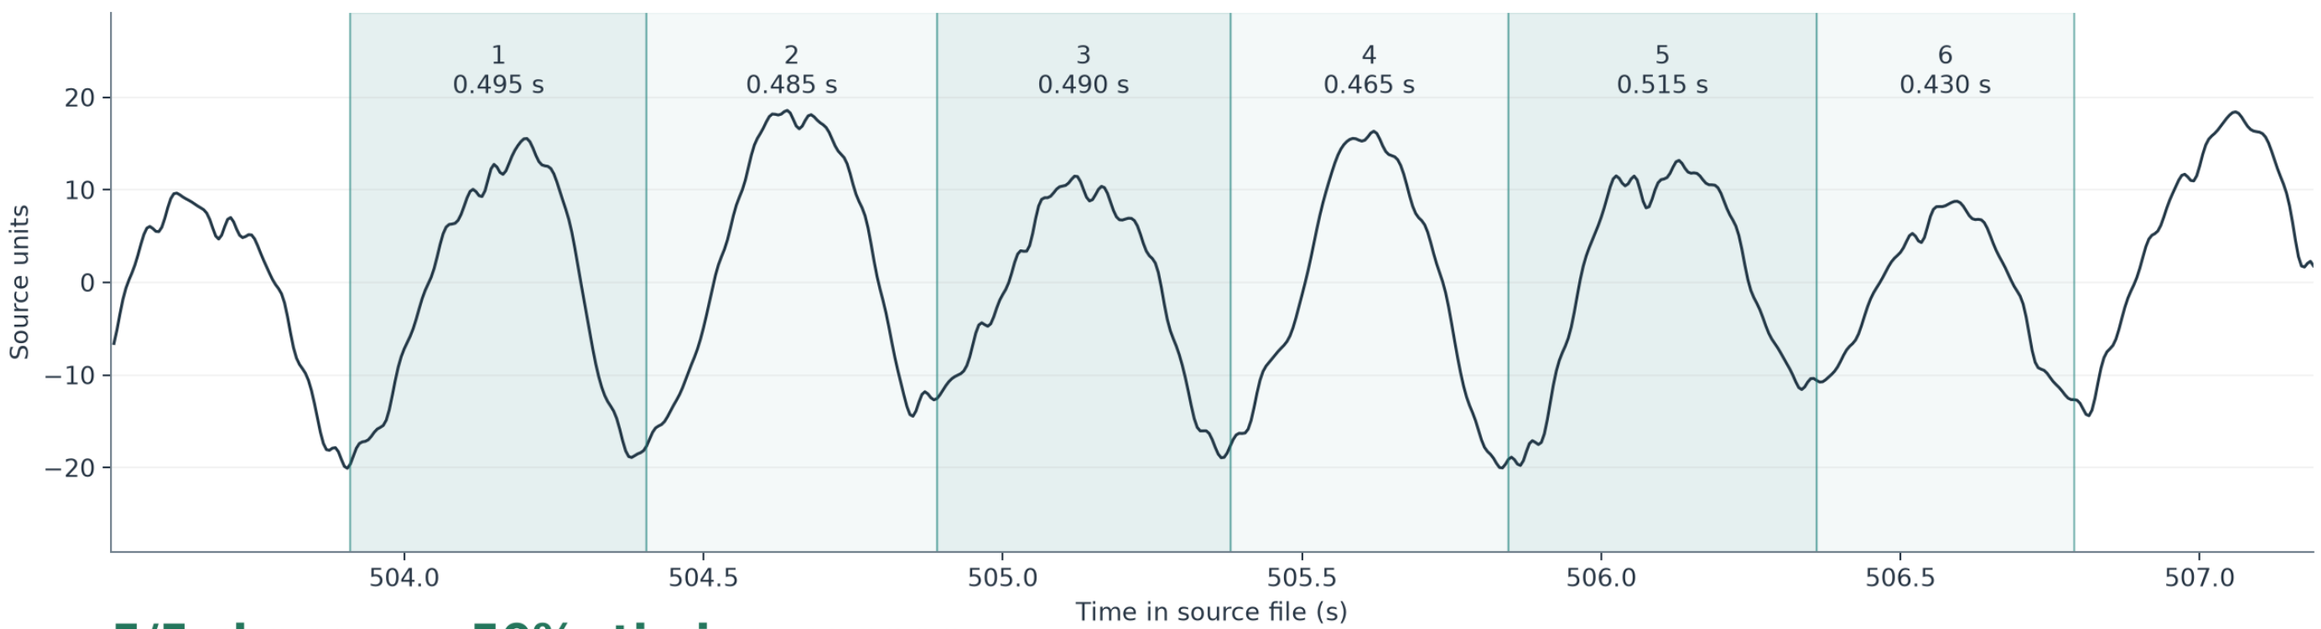

Exactly 50% fails.

Based on ACNS 2021 RDA terminology. Our calculation uses the preceding duration as denominator.

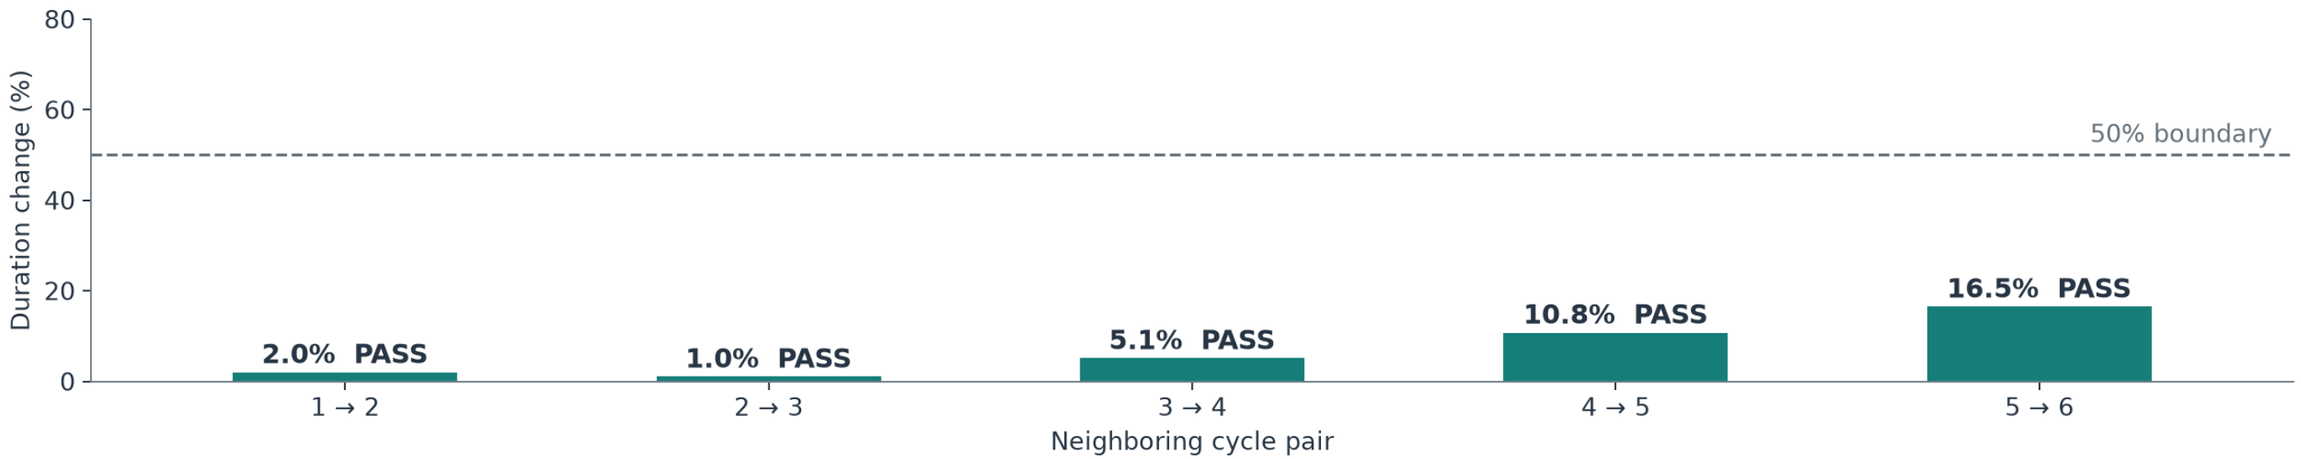

LOW-01 | Timing check

Good GRDA

Fp2-CAR | Six numbered cycles

5/5 changes <50%: timing passes

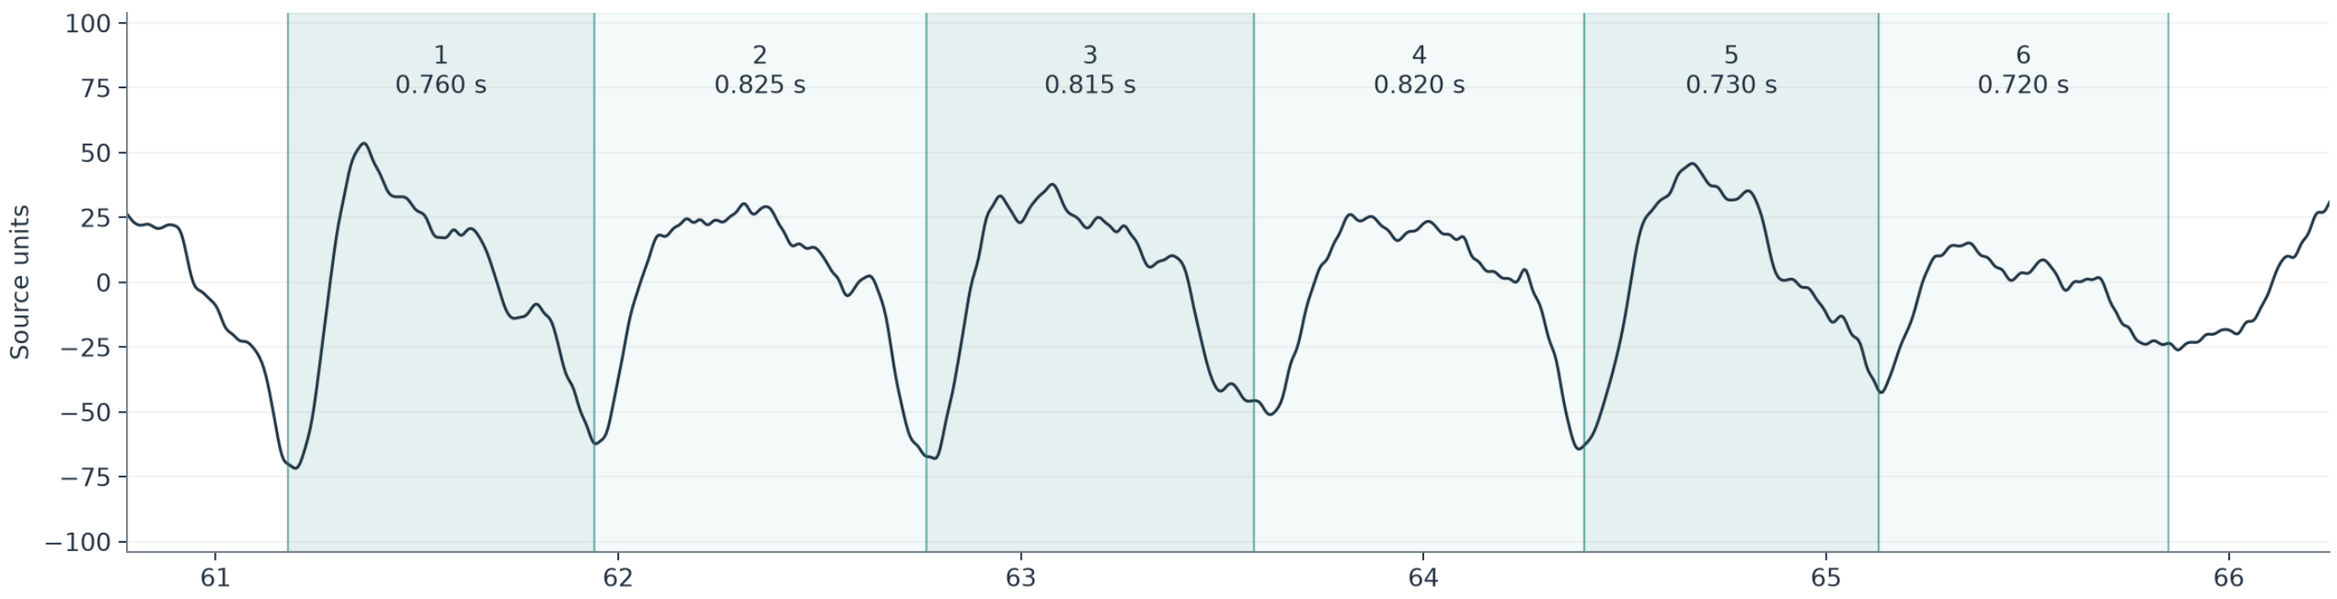

CAR | EEG 0.5-30 Hz | Troughs 0.5-4 Hz

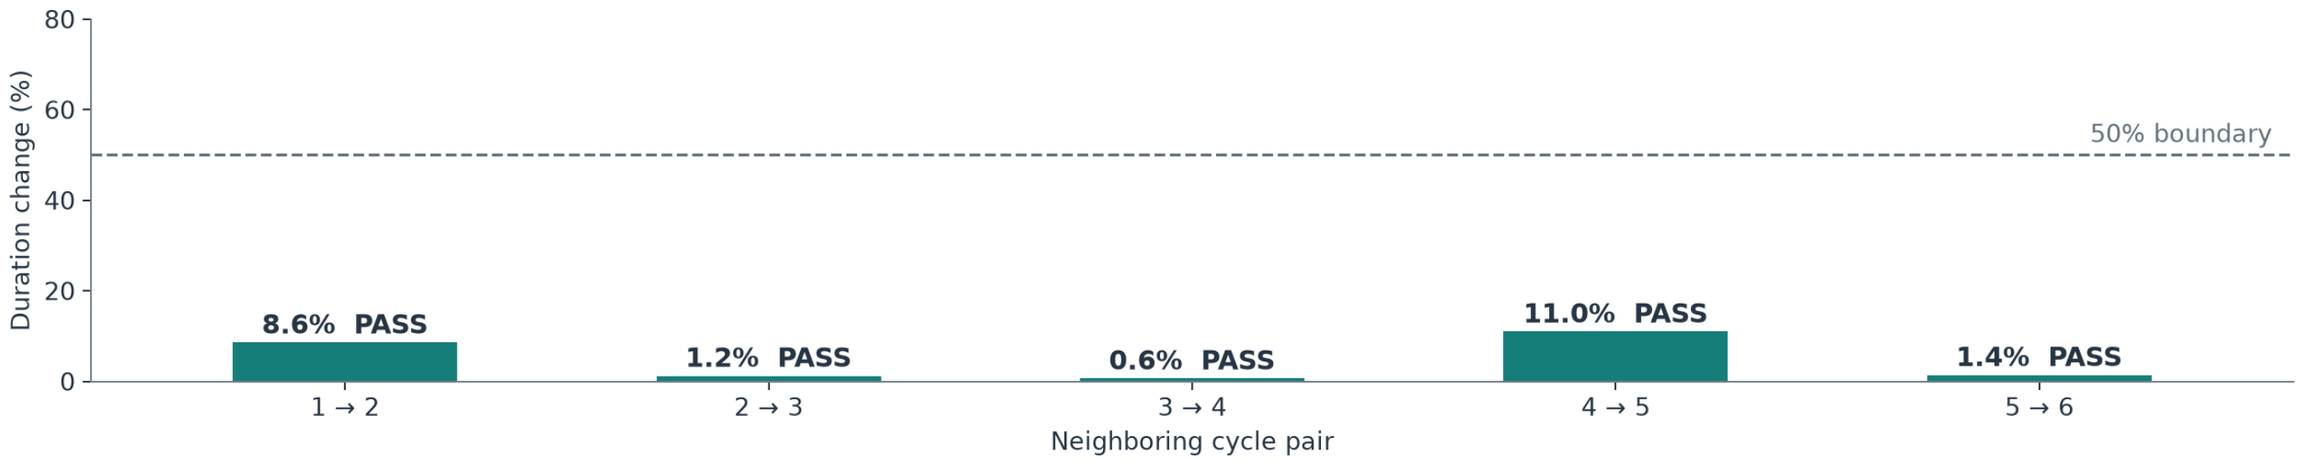

LOW-09 | Timing check

New example

Fp1-CAR | Six numbered cycles

5/5 changes <50%: timing passes

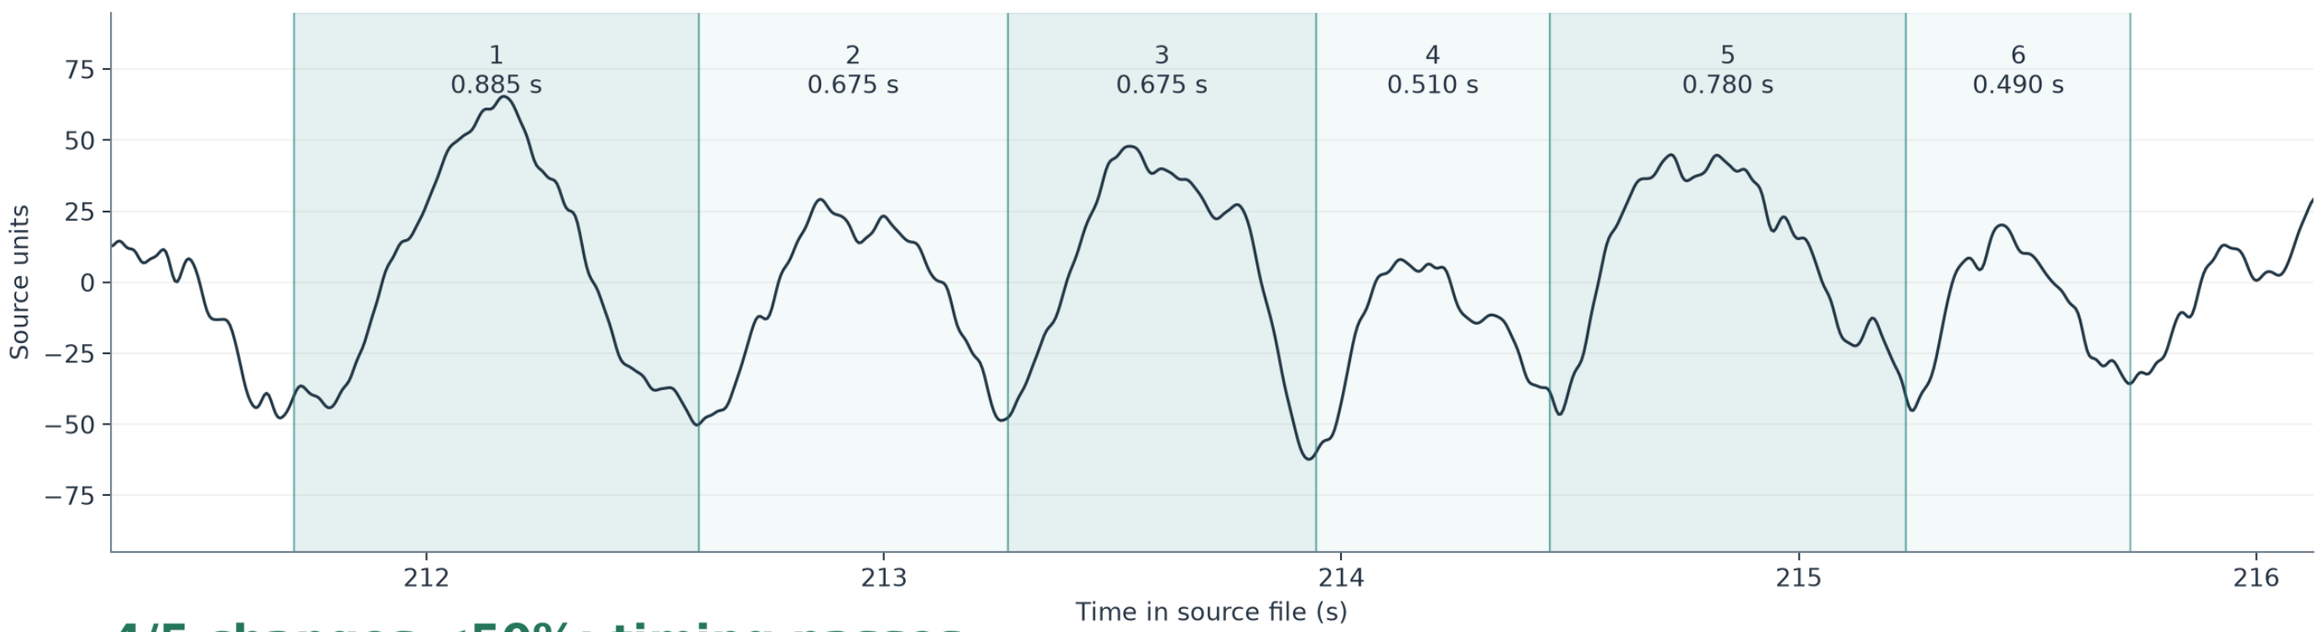

CAR | EEG 0.5-30 Hz | Troughs 0.5-4 Hz

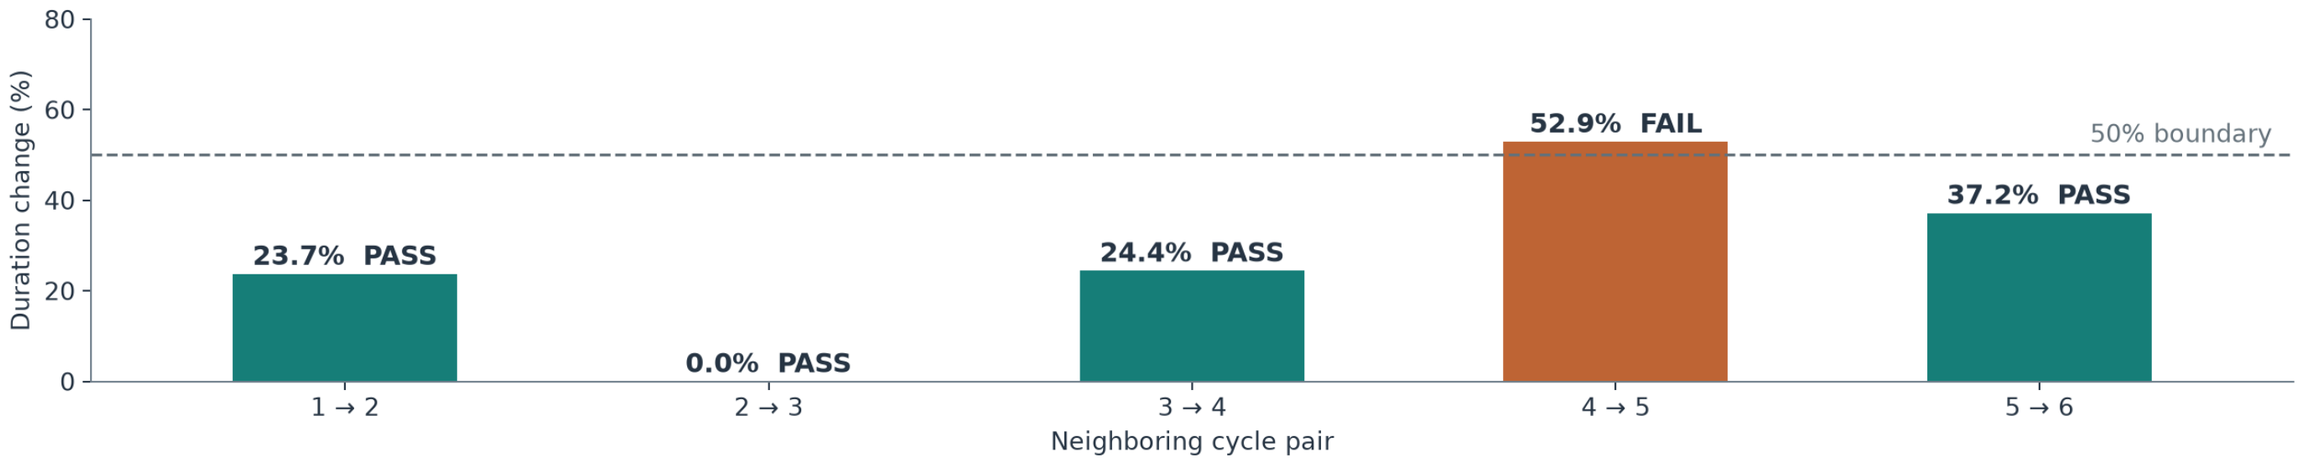

LOW-06 | Timing check

Good GRDA

Fp2-CAR | Six numbered cycles

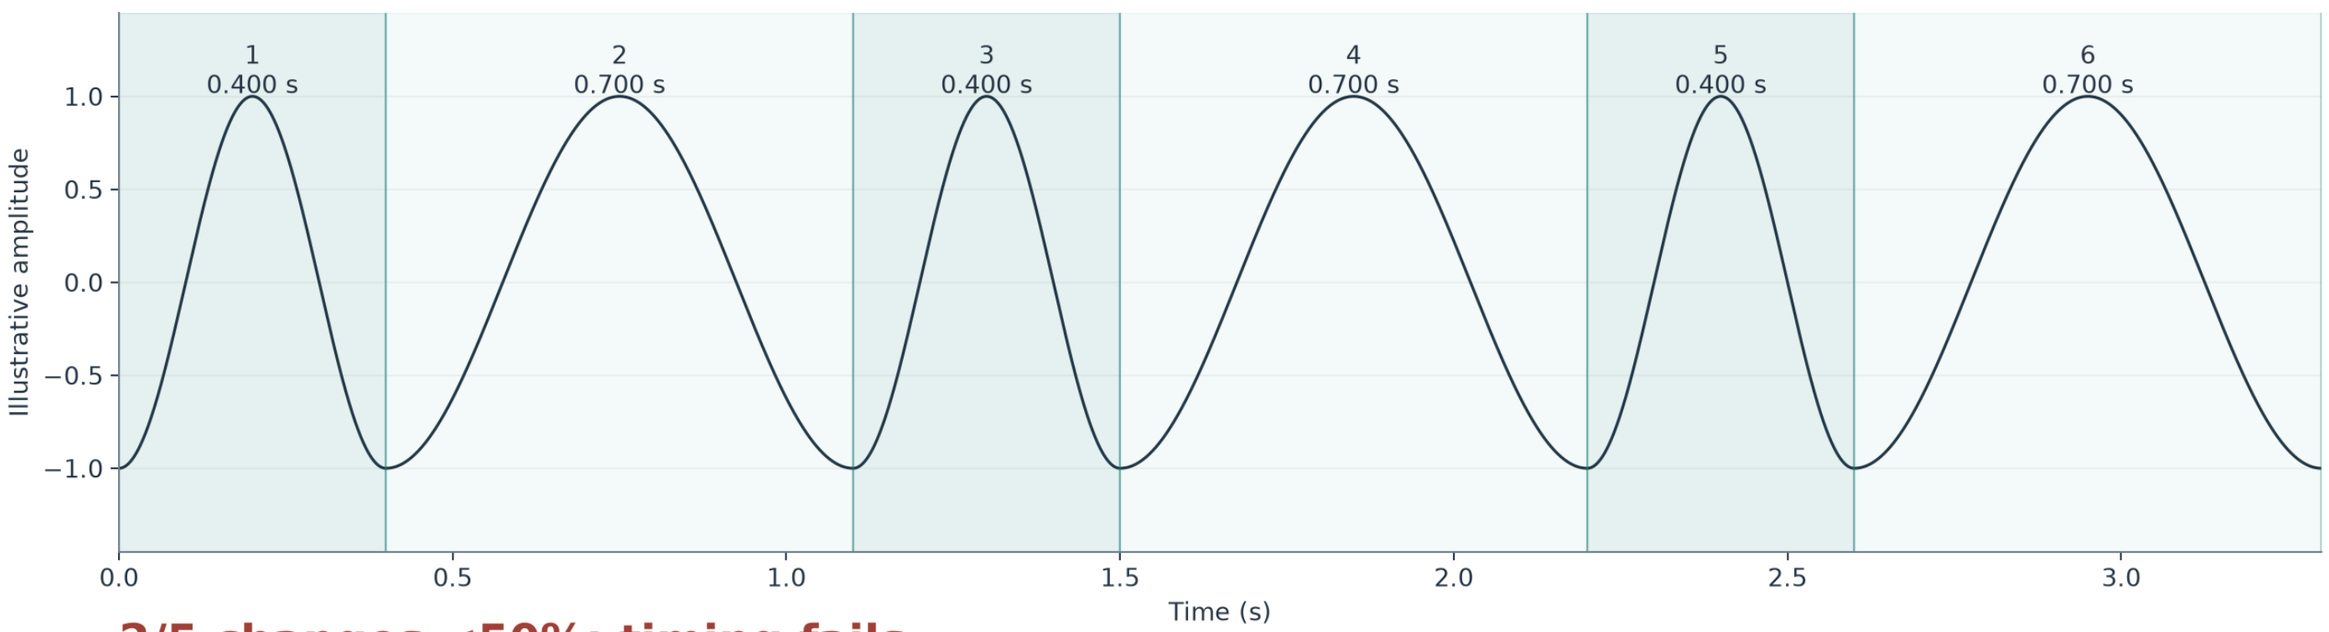

4/5 changes <50%: timing passes

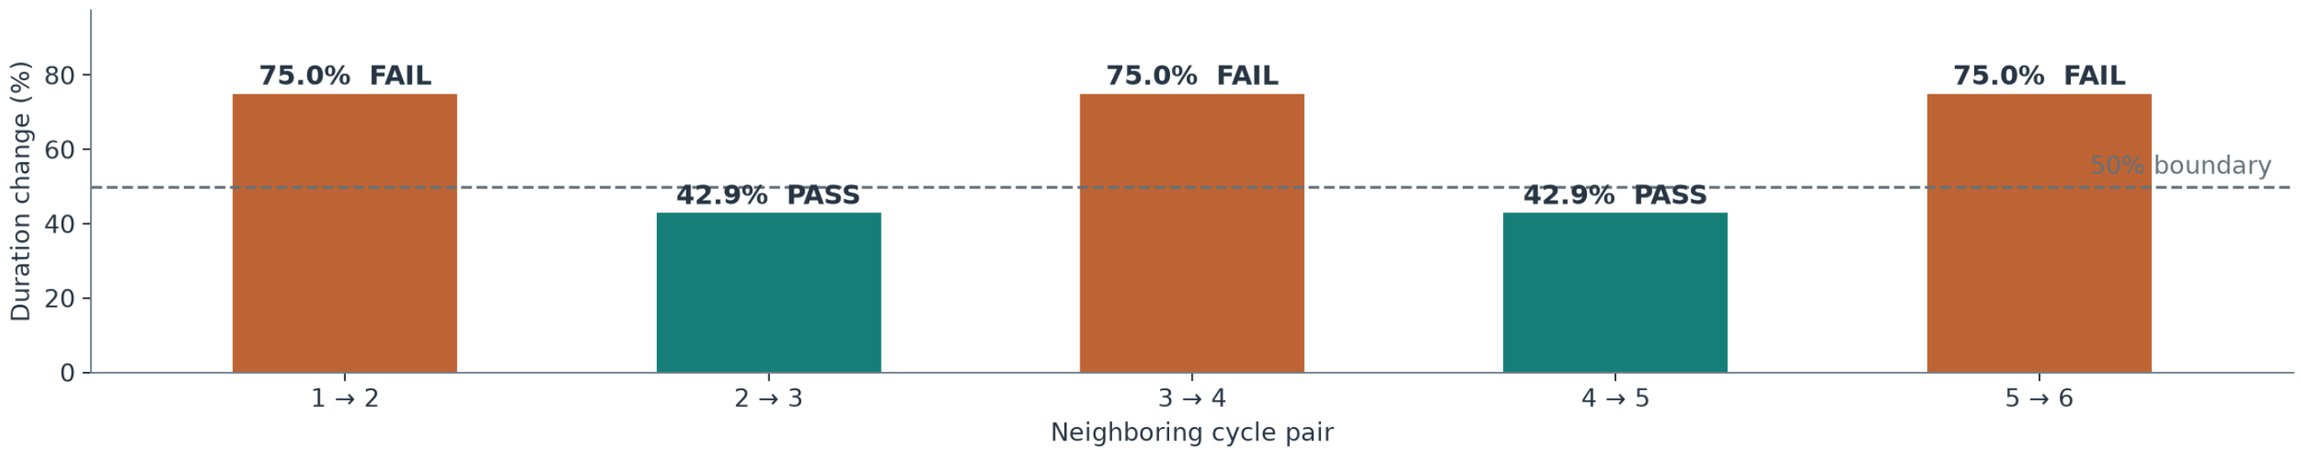

CAR | EEG 0.5-30 Hz | Troughs 0.5-4 Hz

Constructed example | Timing fails

Identical wave shapes; alternating 0.40 and 0.70 s durations

2/5 changes <50%: timing fails

Constructed signal
